

SEO & AI-Search Audit

staalre-new.vercel.app (production: staalre.com)

15 June 2026

HEALTH SCORE

52

out of 100

A static, well-built marketing site with strong fundamentals (fast HTML, clean URLs, correct canonical & sitemap, solid trust block). The score is held back by three concentrated, fixable areas: **media/image weight**, **near-absent structured data**, and **missing human-authority signals** — plus it is a brand-new domain.

Score by category

Category	Weight	Score	Read
Technical SEO	22%	68	Good base; missing security headers
Content / E-E-A-T	23%	54	Sound topics; no named author, thin articles
On-Page SEO	20%	62	Unique titles; H1 not keyword-bearing
Schema / structured data	10%	18	Only homepage has JSON-LD
Performance (Core Web Vitals)	10%	30	Mobile LCP est. 8-12s — worst issue
AI / GEO readiness	10%	52	Crawlable; no llms.txt, no author/stats
Images	5%	35	Huge files, empty/wrong alt text

Overall SEO Health Score is the weighted aggregate of the above (0–100).

Critical — fix first

1. Performance: the hero is ~16 MB of media

warehouse.png is 4 MB and loaded twice (8 MB), **why-us.mp4** is 7.3 MB **autoplaying** with no poster, and there are **11 render-blocking CSS files**. Estimated mobile LCP **8–12s** (Google “Poor” is >4s). The hero is also `visibility:hidden` until JS runs, which delays LCP itself. This is the #1 ranking risk.

2. Preview is publicly indexable while canonical points to staalre.com

Google can index `staalre-new.vercel.app` with nowhere to consolidate (the production domain is not live yet). Add `X-Robots-Tag: noindex` to the preview until the domain cuts over, then remove it.

3. Zero security response headers

No CSP, X-Frame-Options, or X-Content-Type-Options. One `vercel.json` headers block fixes it (also a clickjacking exposure today).

High — within ~1 week

4. Structured data is nearly empty (18/100)

Add **BlogPosting** to the 3 articles (headline, datePublished, author), **BreadcrumbList**, and upgrade the homepage to an `@graph` with **Organization** (logo, sameAs) + **WebSite**.

5. No human authority (E-E-A-T)

No named author (Tex Staal), no founder bio on /about, and testimonials were removed leaving no social proof. Every ranked competitor shows named advisors + track record. Biggest content & AI-citation gap.

6. Search-intent / page-type mismatch

“Warehouse for rent NL” searchers expect listings; “tenant rep NL” expect a credentialed advisory page. The homepage is a brochure with a slogan H1 (“Make Your Move.”). Add an above-fold proof point + sector signal and a keyword-bearing H1.

7. Thin articles with placeholder images

Articles are ~330–400 words, bury the answer, cite no data, and use leftover US-template images (blog-philly-winter-chill.jpg, NYC market report). Weak for both Google and LLMs.

8. No llms.txt; low AI-citation readiness

Your stated priority. Add an llms.txt, front-load article answers in the first ~50 words, and add sourced stats. Crawlers are already allowed — this is about citability.

9. Image alt text

13 empty alts (decorative ones are fine) plus 3 wrong-context alts (“Mortgage Services”, “Property Management”) inherited from the template. Add descriptive, warehouse-specific alt to meaningful images.

Medium / Low

Redundant <title> on /about · og:type=website on articles (should be article) · footer social links are href="#" · no hreflang="en" · no IndexNow · orphaned heavy files in repo (back2.0.png 5.3 MB, og-image.svg) · dead meta keywords · switch RealEstateAgent schema toward ProfessionalService for advisory fit.

Action plan

Implement now (no input needed)	Needs your input
– Convert hero/section images to WebP/AVIF + srcset; de-dupe the double 4 MB image – Video poster + preload=none; preload + fetchpriority on the LCP image – BlogPosting + BreadcrumbList + Organization/Website @graph – llms.txt, descriptive alt text, og:type=article, hreflang – Security headers + preview noindex; drop meta keywords; delete orphan files	– Founder bio + photo for /about (+ Person schema, real LinkedIn URL) – Real social profile URLs; real testimonials / case references – Verified market stats for articles (won't invent rent figures) – New article hero images (can generate options on request) – Per-hub landing pages (Rotterdam / Venlo / Tilburg / Schiphol)

Highest-leverage sprint: **image optimization + structured data + llms.txt + author attribution** — estimated to lift the overall score into the low-70s.
